## Decentralized Access to Top-Tier Open-Weighted AI to Diffuse Technological Dictatorship in AI Advancement

### *Abstract*

*This article examines the relationship between AI access, autonomy, and centralized power. It argues that restricting frontier AI to governments and technology elites reinforces unequal access to knowledge and decision-making. Instead, decentralized access to open-weighted AI is discussed as a way to strengthen public participation, preserve human autonomy, and reduce technological inequality. AI Untuk Rakyat.*

## 1. Introduction

We are told that refusing to integrate AI into our lives is the safer choice. But refusing to integrate AI into our lives only affirms the idea of preserving access for only a selected few: the top five richest tech bros and the government. It solidifies the idea that the public shouldn't be allowed to touch guardrail-free frontier models in the name of cybersecurity.

That sounds legitimate, but it also implies that the public is incompetent and incapable of making decisions on their own, while the elite can. This is reflected in the way America is trying to halt advanced chips from coming into China so that its computation doesn't surpass America's.

## 2. Centralization and Human Autonomy

How are we going to surpass our collective sloppiness if we don't get to decide for ourselves, but instead outsource our autonomy to the external? It sounds ironic for me to say I'm pro-AI while still wanting to preserve autonomy. But what is better than understanding the machine and deciding for yourself, at your own pace, before the elites take the pace to the point of no return?

I'm not here to force people to use AI.

I am here to remind people that others are still deciding the enforcement on us, and soon it will no longer be the people, but the machine. My manifesto is for us to have a part in this machinery.

### 3. Decentralized Access as Public Empowerment

Decentralize access in order to slow it down, rather than whining about how it is causing harm, because the truth is that AI can be used for good.

Let poor people use AI, and embrace its sloppiness. Everything started from somewhere. That is how we water down the polarity of its extremes.

Let the poor kid have access to the same tool that the Victorian elite child has. That is how we solve poverty and world hunger, rather than letting the elites decide that superior models should only be used by the elites and inferior models for the public, because that is what is going on right now.

Open-weighted models are the ones that are going to make AI mundane and typical. Yeah, policymaking would work too—but who's making the policy?

### 4. Conclusion

The question was never whether AI is good or bad. The question is: who gets to decide? If we keep treating frontier AI as something only the elite can touch, we only reinforce the dictatorship we claim to fear.

Open-weighted AI is not about replacing human autonomy—it is about preserving it. Let people learn, experiment, fail, and grow with the machine before the machine grows without them. AI should not belong to the few. AI Untuk Rakyat.
